

Debrief: Refine Hypotheses

The original hypothesis was: **We believe that people will pay to download music which they have been getting for free.**

Below is a sample solution - how does your refined hypothesis compare to this? Don't worry if you didn't end up with the same hypotheses. We're operating on the basis of some assumptions about the Apple value proposition and business model.

Hidden in the original hypothesis are some assumptions about why consumers would pay for something that they used to get for free. It's important to identify these jobs, pains and gains (desirability) and make them discrete in order to understand the consumer's behaviors. If we started out with the original hypothesis, and it was invalidated in an experiment, our insights would be inclusive: we would not exactly know why. Because it's too expensive? Because consumers don't care about low quality? Because we tackled the wrong audience? Because consumers prefer free music over an easy-to-use service?
