

Build, Measure, Learn

0. Generate a hypothesis

Start with the Value Proposition and Business Model Canvas to define the critical hypotheses underlying your ideas in order to design the right experiments.

3. Learn

Analyze the performance of the artifact, compare to your initial hypotheses, and derive insights. Ask what you thought would happen. Describe what actually happened. Then outline what you will change and how you will do so.

1. Design/build

Design or build an artifact specifically conceived to test your hypotheses, gain insights and learn. This could be a conceptual prototype, an experiment, or simply a basic prototype (MVP) of the products and services you intend to offer.

2. Measure

Measure the performance of the artifact you designed or built.
